

Vendor Managed Inventory (VMI)

There is no question that the trend toward contractual arrangements between users and suppliers continues to grow at an increasing rate. IST recognizes that its role in this arrangement is to provide systems that will automate and take costs out of these transactions and provide better information for managing the partnerships.

Remote Bin Stocking provides an easy and efficient way to capture the re-stocking requirements in a Bin Management Program. The use of latest technology hand-held data terminals using the Windows CE language lets the user, you or your customer, easily and quickly capture the data required to create a re-stock order. The re-stock order created within the Intrust Win Sales Order application then allows for the normal order handling of Pick Ticket, Pack List and other related documents. This is enhanced with a Tag File which lets you further define your customer's requirements for each individual item that you manage.

The data captured in the hand-held can be either transmitted to your server or can be directly connected and the data uploaded. This provides the flexibility for serving customers regardless of their geographic location.
